## EXECUTIVE SUMMARY

This report summarizes the findings from Workpackage 3 (WP3) study of the impact the use of information technology and new media has had on distance education in higher education and vocational training. Other than for primary and secondary education rarely any valid result on the impact of the use of technology is available for the tertiary education level. This empirical study aimed:

- To identify new facts about European students' experiences and perceptions of the use of technology in higher distance education including personal benefits or failures, increased or deepened knowledge, behavioural changes that were affected by the use of ICT in education or new opportunities to organize the personal learning process
- To determine attitudes towards the use of technology in higher distance education
- To determine students' opinions about the quality and recognition of university degrees awarded by open and distance universities.

Based on a collection of questions provided by the partners, a sub-committee designed a questionnaire that was grouped in three sections: 1) personal information, 2) experiences with technology-enhanced learning, and 3) questions related to technology supported distance learning experiences. The rationale behind this structure was to reuse the questions in Sections 1 and 2 in the analysis of other facets of technology-enhanced learning and teaching and just adapt the questions on Section 3 to the particular subject under investigation.

An intervention group was formed with 150 students from FernUniversität in Hagen and five control groups were identified with 30 students each from the five other partners in the consortium. The members of the intervention group were supposed to have experience with distance education at a higher institution, while the members of the control groups should lack such experiences. In all groups experiences with technology-enhanced learning was expected to vary. In the end we were able to recruited 183 completed questionnaires from individuals in the intervention group and 150 from members in the control groups. The collected answers were finally analyzed using various statistical techniques.

The following provides a brief synopsis of findings from this research. For detail and evidence, review the appropriate sections of this document.

### *1. Impact of ICT on learning in general*

In the population at large ICT already plays an important role in people's daily life and most participants take a positive attitude on its' impact. Among the five occupation groups being surveyed, teachers and trainers use the advanced technological equipment in their professional life most frequently. More than 70% of respondents agreed that their ways of working has been changed by the development of technology. More than 80% of the participants found that the impact of ICT on their learning is valuable according to their own study experience. In addition, a significant number of participants (more than 50%) believe that the problems of access to learning for students with disabilities have been resolved thanks to technology with only a small portion (around

**Final Report of WP 3**

10%) disagreeing. It is important to note, however, that students exhibit a more negative attitude on this issue (around 30% disagree).

*2. Impact of ICT on learning in open and distance universities*

Most participants agree that ICT facilitates easier access to material for those studying part-time (90%) and its application to support learning and teaching and providing Internet access to student administrative processes has improved distance education (75%). Among the contributions of information and communication technology, multimedia environments are most widely accepted in open and distance universities. 80% of the population agrees that learning is enhanced when text and pictures are integrated in a multimedia environment. On the contrary, while still being the majority, only 50% participants agree that ICT was used to provide individualized learning programmes.

*3. Effectiveness of the use of advanced technology in distance education with respect to increased motivation and active involvement, personal interaction and improved learning*

A majority of participants agreed that ICT was used to encourage active learning participation and develop high level thinking skills such as synthesis and problem solving. Especially, educational games received general acceptance as an effective way to develop skills like teamwork. Teachers and students particularly support these opinions. An interesting observation here is that teachers and students take a controversial attitude on the contribution of ICT to the issue of intensified personal interaction. Most teachers believe that online communication allows increased amounts of communication between teachers and students while relatively few students support this point of view.

*4. Recognition of open and distance universities*

The agreement that a study at an Open University is especially advantageous to adults who have work and family obligations, is overwhelming in both groups. However, especially in the control group a great deal of uncertainty exists (more than 42%) about the comparability of degrees awarded open universities and traditional face-to-face universities. In the intervention group, which just includes people who have made distance study experiences, much less uncertainty can be observed about this thesis, while the degree of agreement is about twice as high as in the control group. Similar differences exist for both groups with respect to the quality of learning outcomes at open universities as opposed to face-to-face universities. In both groups the level of uncertainty dominates in this question.

## 1. OBJECTIVES AND RESEARCH CONTEXT

This research project aims to compensate the current lack of research information on the impact of technology on adult education, in particular, in the context of distance learning and lifelong learning. This report is the first in a series, each addressing a different context of the use advanced technology in learning and teaching at universities and vocational institutions. It focuses particularly on the growing field of distance education. According to Desmond Keegan (1990), distinguishing characteristics of distance education include the:

- Separation of the teacher from the learner(s)
- Use of technical media supporting communication and collaboration among students and their teachers;
- Influence of an educational organization.

In this study we investigate empirically whether and to what extent known difficulties of the distance education model have been toned down or even been removed. We also try to find out whether the strengths of distance and open universities including elaborate learning content and strong, tutorial, organisational and administrative support have been enforced by the use of advance technology.

### 1.1 Setting the Scene

In distance education the use of technology is essential. It is not a supplement to the traditional forms of distance education: correspondence and telecommunications-based education. The history of distance education reaches back to the 18<sup>th</sup> century when it took the form of correspondence education first. It was supplemented later by telecommunications-based distance education, which relies on a synchronous form of delivery and interaction. But only after the early success of the British Open University a wave of foundations of distance teaching universities in Europe and the United States during the 1960s and 1970s provided real alternatives to traditional classroom-based higher education, offering large numbers of adults disadvantaged by limited time, distance or physical disability a second chance at higher education.

In Europe and elsewhere, developments in information and communications technology (ICT) throughout the last decade have substantially changed the format of distance education from correspondence-style courses to technologically based courses using the Internet. The use of various forms of electronic media, e.g., for the submission of assignments and their correction, for performing Internet-based seminars, laboratory experiments and collaborative class activities, has increased time and cost effectiveness and improved the exchange of information. Interactive computer-based learning applications, instructional animations, video or audio are believed to enhance the quality of learning materials. New methodological approaches to learning in technology-based educational scenarios have been developed, promising a wider range of teaching functions and a higher quality of learning, more interaction and feedback for distant students.

But also the culture in traditional campus universities has changed tremendously. The initial period of individual e-learning pioneers is gradually being replaced by an organisational integration of technological innovation and e-learning processes in European universities. In Germany and other European countries these transition processes, which aim

## Final Report of WP 3

at a sustainable embedding of e-learning in universities affecting administrative processes and services, teacher and tutor qualification, content development, curricular structures and quality assurance, are supported by nationally funded case studies and lighthouse projects.

### 1.2 Objectives of the Project

Distance education is a rich and complex sector today comprising five major fields of education and training provision that are detailed here for the first time:

- **Distance education** –providing education and training at a distance by Open Universities, distance education institutions and a growing number of distance education departments of conventional institutions
- **E-learning** – e-learning covers a wide set of applications and processes, such as Web-based learning, computer-based learning, virtual classrooms, virtual learning environments like ILIAS, Moodle or WebCT and digital collaboration. It includes the delivery of content via Internet, intranet or extranet, podcast and videocast, satellite broadcast, interactive TV, and CD-ROM or DVD. But e-learning also provides instructional interactivity, which differentiates learning from mere e-publishing (Allen, 2003).
- **Synchronous e-learning systems** – providing education and training on the WWW to students who study mainly in groups using LMSs with elaborate synchronous communication features like Centra or Horizon Wimba.
- **Blended learning** – using hybrid learning arrangements combining on campus presence in lectures, exercise and practice groups or Instructor Led Training (ILT) and online phases using the WWW and ICT.
- **Mobile learning** – providing education and training on PDAs (including palmtops and handhelds), smartphones and mobile phones.

Along these axes of education and training provision, the project pursues a series of work-packages whose ultimate goal is to present a set of findings that help instructors understand the implications of various technologies for their students, and to provide research-based principles for how instructors can best use technology in their teaching. As mobile learning has been extensively investigated before by a previous project led by nearly the same consortium, the first four facets of distance education are the focus of this work.

This report addresses the situation of distance students who may have been exposed to the use of technology in varying degrees of intensity ranging from mere correspondence education at one end of the spectrum to a rich inventory of technologies, including learning and course management systems (WCET, 2007; Baumgartner et al., 2002), learning activity management systems (LAMS International, 2007), computer-supported collaborative learning tools (Kumar, 1996), interactive and multi-media learning materials, computer-based simulations and laboratories (Goodman, 2007), micro worlds, smart tutoring programs or automatic self-assessment tools, at the other end.

This report contains the results of the project's first data acquisition and analysis work-package, WP3, which took place from January to June 2007.

### 1.3 Project Consortium

The project consortium represents a good mixture of cultures including western, central, eastern and southern Europe. It represents an interesting combination of target groups including campus education of young adults, distance education with a large number of working professionals at a mean age of 29, and vocational training focused on business and technical experts. Correspondingly the type and intensity of technology in the learning process varies to great degree.

[Corvinno Technology Transfer Center](#), Hungary, is the technology transfer company of the Department of Information Systems at the Corvinus University of Budapest. Its main focus is both on teaching and research of IT applications in business and in the public sector. Corvinno is continuously working to develop educational programmes in information technology, so as to best fit the university's profile and enable economists to manage information systems in real-life situations. Corvinno's role in the Impact project is to gather data from the Hungarian students about their ICT usage in their everyday learning activities.

[Distance Education International](#), Ireland, has made extensive contributions to the literature of distance education and e-learning, has participated in a wide range of European projects and has edited the world's only series of academic volumes on distance education.

[Ericsson Education Ireland](#) is part of Ericsson, the telecommunication infrastructure provider. As part of Ericsson Global Services, Ericsson Education is one of the leading providers of training solutions to the telecoms industry. It has led a number of EU research projects, most notably in the field of mobile learning.

[FernUniversität in Hagen](#), Germany, is the only public distance teaching university in Germany serving also other German speaking countries in Europe. FernUniversität provides its 48,200 students with a range of university degrees. The project team from FernUniversität has pursued and led a range of R&D projects on learning technology both at the European and national level and is involved in higher distance education in computer science and electrical engineering, mathematics, law, social and culture sciences and economics.

[Plovdiv University](#), one of Bulgaria's largest universities situated in Plovdiv, Bulgaria's second largest city. There are eight faculties: Physics, Mathematics and IT, Chemistry, Biology, Economics and Social Sciences, Law, Languages and Literature, and Education. The University takes part in international programmes, such as TEMPUS, COST, NATO, Leonardo, CEEPUS, 5FP, and Marie Curie fellowships and in sub-programmes including the Socrates programme - Comenius, Erasmus, Minerva and Jean Monet. The University has a firm commitment to the use of technology in education and has extensive technology facilities. The University of Plovdiv has considerable expertise of the impact of technology on learning and will contribute expertise and data especially in the fields of distance learning, e-learning and the use of the WWW on-campus.

[University Roma Tre](#), Italy, is a leading university in public distance learning. The LPS ([Laboratorio di Pedagogia sperimentale](#)) is a research unit that has been operating within the Department of Education Sciences of University Roma Tre for over ten years. LPS aims to contribute to the development of education culture by devising and implementing

## Final Report of WP 3

experimental research initiatives. The Laboratory publishes the review *Cadmo. An International Journal of Educational Research*, cooperates in national and international research projects, conducts higher education activities through the Ph. D. course entitled *Innovation and Evaluation of Education Systems*.

### 1.4 Acknowledgements

The team wishes to acknowledge the support and help given to the publication and distribution of the first questionnaire and the assembly of student responses by administration staff of the partner institutions. We are particularly grateful to Dr. Christine von Prümmer and Ute Rossié from the Rector's Evaluation and Quality Assurance Team who prepared the German online questionnaire and processed the 183 responses collected at FernUniversität and Ute Wandel from FernUniversität's student office who compiled the sample of students questioned. Volker Winkler was extremely helpful in the production of the PDF version of this report.

## 2 RESEARCH METHODOLOGY AND APPROACH

The research methodology proposed by the project to test the impact of the introduction of new technology on adult learners was randomized controlled trials. We adopted a widely used rule of thumb that requires a sample size of 300 people with 150 in the intervention group and 150 in the control group. A point of discussion in the project was the definition of the statistical method to be best used. Our experts from Rome proposed to use inductive statistics because only weak agreements exist on the meaning of variables. One of the goals of the project should therefore be to define a number of variables that can be shared in the scientific community in Europe.

### 2.1 Research Hypotheses

Our research hypothesis comprises three facets:

- “There is no significant difference in the judgement of people with or without experience in learning at an open or distance university that the use of technology in distance education can overcome several disadvantages of this study model including impeded interaction between tutors and students, indirect communication, or reduced opportunities for social interaction.”
- “It is generally accepted that the use of technology in higher distance education is beneficial for the student population at large and for special needs students in particular.”
- “It is generally accepted that the education provided by open university compares with that of campus universities and the degrees awarded by open universities are equally well recognized as those awarded by traditional campus universities.”

### 2.2 Methodology: Principles and Approach

The research methodology employed was organized in six stages:

- 1) Collect problems to be investigated from partner institutions.
- 2) Form a sub-committee of experts in data analysis in social sciences whose task was to:
  - a. Develop a conceptual model guiding the data analysis and
  - b. Devise a questionnaire based on the problems contributed in stage 1).
- 3) Review, test and approve the questionnaire by all the project team.
- 4) Administer the questionnaire to the six target groups after translating it into the local language – if necessary.
- 5) Assemble the responses acquired by each institution and perform suitable data analyses.
- 6) Evaluate the analysis results and present them in a comprehensive report (this document).

## Final Report of WP 3

A range of statistical analyses were applied to the collected data including descriptive statistics covering the whole population of respondents, t-tests comparing the intervention and control groups, non-parametric correlations, cross-tables or variance analysis.

### 2.3 Conceptual Model and Research Topics

The conceptual model underlying the themes to which this and follow-on investigations should provide replies include:

**Reaction of learners:** Did they enjoy and benefit from the education using ICT?

**Learning outcome:** Did the students increase in knowledge or intellectual capacity?

**Behaviour:** Did the students apply technology-enhanced learning and thereby change their behaviour?

**Result:** Were there quantifiable aspects of organisational performance gain?

**Technology:** Can we prove or disprove that the increasing use of technology in education is perceived positively?

**Attitudes:** What are people's attitudes to the impact of technology on learning?

**Gender:** Does the use of technology enhance the learning process of female students? Do female students benefit from learning traditionally "male" subject areas (engineering) through gender-neutral media like Centra?

**Student-centred and task-based learning:** Does the use of technology in the learning process create opportunities to prioritise task-based learning?

These facets of the conceptual model guided the design of the items and structure of the questionnaires used in our empirical study.

### 2.4 Questionnaire Design

*“Statistical designs always involve compromises between the desirable and the possible.” (L. Kish, 1987)*

The questionnaire was designed to consist of three sections:

- 1) Personal information including social indicators like gender, age, profession, or education as judgements depend on such indicators.
- 2) Experiences with technology-enhanced learning, and
- 3) Questions related to technology-supported distance learning experiences.

The rationale behind this structure was to reuse the questions in Sections 1 and 2 in the analysis of the other three facets of technology-enhanced learning and teaching (e-learning, synchronous e-learning and blended learning) as well. Only the questions in Section 3 were adapted to address the corresponding investigation topic.

## Final Report of WP 3

For the sake of succinctness and clarity, only closed questions should be used. As we wanted to test primarily perceptions, attitudes and opinions about the impact of technology on distance education, it was decided to use stated views as questionnaire items in Sections 2 and 3 and allow answers uniformly on five-part scale ranging from a high degree of agreement to complete disagreement. The odd number of possible answers has the advantage that respondents who are neither pro nor cons can express their uncertainty about a particular item in the questionnaire.

To avoid and to be able to detect acquiescence, some statements were formulated negatively, e.g., item 10 (see Annex A.1): “Only optimistic people think that the impact of technology on learning is beneficial.”

All four questionnaires were reviewed, partly improved and tested for completeness, exclusiveness and uniqueness by the whole project team during a project meeting held in March 2007 in Plovdiv. The questionnaires were then approved by the whole project.

## 2.5 Characteristics of Intervention and Control Groups

As distance education was the main objective of this investigation, FernUniversität in its role as an open university was selected to form the intervention group among selected members of its student clientele, while the other partners together provided an equal number of respondents in five different control groups.

### ***2.5.1 Intervention Group: 150 Students enrolled in a Distance University***

The respondents for the intervention group were 150 students at FernUniversität in Hagen, the only German speaking distance teaching university with approx. 48.200 students.

To ensure a sufficiently high number of responses, 1.500 students were selected from FernUniversität's student database (see Fig. 1). Selection criteria were:

- 1) Students enrolled in at least three different departments to catch cultural differences between disciplines
- 2) Students from different study phases
- 3) Different degrees of exposure to learning technology and multimedia learning content in distance education
- 4) Balanced gender distribution
- 5) Both part-time and full-time students.

## Final Report of WP 3

**2.5.1.1 Determining the Samples**

We chose 356 bachelor students enrolled in the curriculum Educational Sciences (ES) to meet the first criterion because these students are both exposed to different types of learning technology like Moodle, CSCL tools or synchronous communication and collaboration tools and are concerned with advanced learning technology standards and educational theories. The second group included 400 law students (BL) who have lesser experiences with advanced learning tools but have excellent experiences with novel and interactive multimedia learning materials. 437 students selected were enrolled in Business Informatics (BI), i.e., a cross-disciplinary curriculum that combines technical skills with business know-how. A fourth subgroup included 209 masters students enrolled in the Electrical Engineering (EE) curriculum and 98 law students in a masters program (ML).

The spread over different study phases ranging from second semester bachelor students to master students obviously addresses criterion 2 quite well.

ES and BL students are exposed to learning technology beyond average, while BI and EE students are familiar with technology in general but their experience with learning technology is rather average. The ML students basically rely on correspondence material and standard online communication facilities like e-mail or newsgroups.

Overall the gender distribution in the target population was relatively well balanced with 873 male and 627 female students. Inside the subgroups we notice, however, a striking imbalance with 1 male to 5 female among Educational Science students and 12 to 3 among BI or 10 to 1 among EE students. In total we had selected 1228 part-time students and 272 full-time students.

**2.5.1.2 Questionnaire Preparation**

Due to the large number of students who were contacted via e-mail by FernUniversität's student secretary, we developed an online version of the questionnaire to automate the collection of responses automatically in a backend database. This had the additional advantage that we were able to control the completeness of each questionnaire as students could only advance to the next page (using button "weiter" in Fig. 2 and 3) if each item on that page was checked.

The original questionnaire was translated into German to increase its readability, avoid possible misinterpretations of items by non-native English students (see Annex A.3.2). A cover page accompanying each e-mail was designed to briefly express the (see also Annex A.3.1):

- Purpose of the questionnaire,
- Responsible organizer (here: Prof. Krämer from FernUniversität),
- Average time needed to answer all items (approx. 10 minutes),
- Deadline,
- Contact person and e-mail address, and
- Information about guaranteed anonymity.

Email: [Dr. Christine von Prümmer](#) [Ute Rossié](#) © FernUniversität in Hagen

**Figure 2: Item 1 partly opened for test purposes**

To test the adequacy and completeness of answers to Question 1 (“What is your occupation?”), we opened up this item by adding the option “Other” including a free entry field to allow respondents who were not confident with one of the possible answer to provide specific information about their occupation (see Fig. 3).

#### **2.5.1.3 Announcing a Raffle**

To increase the students’ interest in the study, we decided to give away five science fiction books authored by a world-famous computer scientist. Students who wanted to enter the raffle had to acknowledge their wish by entering a valid email address in a text input field or reject the offer by checking the button underneath that input field entitled “Ich möchte meine E-Mail-Adresse nicht angeben” (I don’t want to provide my email address, see Fig. 3). The note at the top of that page also included the assurance that this information would only be used to enter the raffle and contact the winners.

Figure 3: Webpage announcing the raffle of five books

#### 2.5.1.4 Organisation of the Online Questionnaire

The items in Sections 2 and 3 of the questionnaire were organized in two tables so that students could easily survey all aspects relevant to the actual theme of the questionnaire (i.e., “the impact of ICT on learning in general” and “the impact of ICT on learning in Open Universities”, respectively, cf. Fig. 4). The items in Section 2 addressed aspects like access to learning for students with disabilities, personal contact and online communication, more involved students or improvement in learning outcomes. The aspects investigated for the narrower theme of learning independently at a distance included: access to administrative processes or easier access to material. Here we also investigated personal judgements of the quality and recognition of degrees awarded by open universities.

#### 2.5.1.5 Collecting Responses

183 completed questionnaires were collected in the intervention in a database while the website at <https://eva.fernuni-hagen.de/mrIWeb/mrIWeb.dll?I.Project=dvtprojekt> was open between May 7 and 29, 2007. The data were extracted in an Excel file and communicated to the Italian partner for further data analysis.

As the interest in the raffle was unexpectedly high with 159 positive responses, we increased the number of books to 9 and the chance to winning to 5.7%. The draw was concluded May 30 and all winners received their price by June 8, 2007.

Figure 4: Items related to the impact of technology on Open and distance universities

### 2.5.2 Control Group 1: 30 Students without Experience in Technology-Enhanced Learning from Bulgaria

The English questionnaire was translated first into Bulgarian (see Annex A2) to make life easier for local respondents. Then lecturers at the Agricultural University of Plovdiv handed out printed copies of the Bulgarian version of the questionnaire to randomly selected students of that university during their class. After the students had completed their questionnaires, they were collected and the data was compiled in an Excel sheet that was finally transmitted to the Italian partner who performed the collected data analysis.

The reason why students at the Agricultural University were chosen rather than students at the project partner's own institution is that Plovdiv University offers study programmes in

### Final Report of WP 3

Natural Sciences, Economics and Social Sciences, Mathematics and Informatics, Chemistry and others, which makes it difficult to randomly find students with little or no exposure to ICT in a learning context, which was a desired characteristic of this control group. Students from the Agricultural University satisfy this criterion much better and at large.

#### **2.5.3 Control Group 2: 30 Faculty Members from Corvinno, Hungary**

As in the German and Bulgarian case, the Hungarian partner translated the questionnaire to Hungarian first, before an on-line version of that questionnaire was produced and made available at:

<http://sirius.uni-corvinus.hu/targyertekeles.nsf/login?open&id=GKIK-73HNXH>.

Then the study objectives and rationale were disseminated among the faculty SIG (a Special Interest Group consisting of current and alumni students, who are interested in Corvinno's activities). 50 anonymous login codes were prepared for the members of the SIG community and sent via email.

As the website was open, submitted responses were collected automatically and after the 30<sup>th</sup> filled out questionnaire came in, the collected results were submitted to the Italian partner for data analysis.

#### **2.5.4 Control Group 3: 30 Adult Learners without Experience in Open and Distance Education from Ireland**

The persons who filled in the questionnaires under the direction of Distance Education International (DEI) were students at Cork Institute of Technology, Bishopstown in Cork, Ireland. They were all enrolled in adult education courses at Cork Institute of Technology. Many of them were female and many were over 40 years of age.

They were chosen for the control group because they had no experience of study at an Open University or in a distance education system.

The questionnaires were administered to the respondents in a class situation in an evening course and filled out in the presence of the teacher.

30 responses were received and communicated to the Italian partner.

#### **2.5.5 Control Group 4: 30 Vocational Students from Ireland**

Approximately 55 questionnaires were distributed to groups within Ericsson Education and to groups in a local third level college. The feedback was rewarding and the target of 30 was met. The groups were chosen to reflect experience with distance education and open universities.

The majority of the respondents came from Ericsson Education. In Ericsson Education the respondents were primarily from the categories of management and training consultants. With regard to the third level college the respondents were lecturers and students.

All data was sent and responded to in electronic format.

#### ***2.5.6 Control Group 5: 30 Postgraduate Students in Educational Studies from Italy***

The data were gathered among postgraduate students enrolled in Roma Tre University. Over 56 questionnaires were collected; only four respondents were male, following the general pattern in the courses in Education offered by the University. The groups were chosen in order to represent this particular tier of students.

The questionnaires were administered before classes, giving to the respondents all the time needed for answering. Data were then entry in electronic format.

#### ***2.5.7 Summary about the Composition of Groups***

From the description of the selection of samples in the intervention and control group we can conclude that we have achieved a good mix of different nationalities, age groups, professional backgrounds and career or study stages, and different modalities of education including traditional face-to-face teaching of young adults on campus, education of working adults in evening classes and in distance and open universities and vocational training for professionals. We have a good spread of study disciplines with agricultural science, engineering, social sciences and law. The samples in both group exhibit different levels of exposure to technology, in general, and in education, in particular, while experiences with distance and open universities only exists in the intervention group.

### 3 REVISION OF THE QUESTIONNAIRE

In the intervention group 67 respondents marked category “Other” of the occupation item (Item 1) and entered a specific job name, which means that they were uncomfortable with the other categories given. With a generous interpretation of the job names listed by the respondents, 45 of these nominations can be mapped to category “Technical”, 5 to category “Student”, and 9 to category “Unemployed”. The other 9, however, did not fit and would require new categories “Self-employed” (8) and “Retired” (1).

The consortium therefore decided to add these two categories to the questionnaires to be used in workpackages 4 to 6.

A special problem occurred with category “Student” because every person in the intervention group is a student of FernUniversität. This made students read the question as “Full-Time students”, which is typically a minority among open and distance university students. The 5 respondents who voted for “Other” but could be considered students in a wider sense are people in a trainee program or apprenticeship.

Another problem was detected with the answer categories in Item 4 (level of education) because the time periods appeared to be awkwardly defined. In the next version of the project’s questionnaires, the category “One to three years of post-secondary education” will be replaced by: “Three years or less of post-secondary education”.

## 4. DESCRIPTIVE STATISTICS AND COMPARISON OF SAMPLES

The total sample size of the study was 359, which was nearly equally distributed between two groups: the intervention group with 183 and the control group with 176 samples. Different analyses were applied to test our hypothesis. A descriptive analysis of the intervention and control group and cross-tabulation was performed to understand the characteristics of both groups and to find homogeneity and differences between them. Cross tabulations helps us to look at the relationships between nominal and ordinal variables.

The results of these analyses are selectively presented in Subsections 4.2-4.4. All corresponding statistical analysis data are presented in detail in Annexes B.1 to B.3. B.1 and B.2 comprise the descriptive statistics, B.3 present the cross-tabulation of both investigation groups. Summary tables for the answers are also included in the annexes as well as Chi-square tests and comparison bar charts, some of which are shown in the main text as well.

The Chi-Square gives us a measure of the statistical significance or probability value and tests the hypothesis that the row and column variables are independent or unrelated to one another. To be able to say that a relationship is statistically significant, the p-value needs to be as small as possible. The value used is less than 0.05 (confidence level of 95%). In the tables, it is therefore necessary to inspect the “Pearson Chi-Square“-row in the “Asymp. Sig.”-column. If the p-value is less than 0.05, this means that there is a low probability that the differences we have found are due to chance.

The t-test presented in Section 4.4 allows us to compare the means of the two sample groups.

### 4.1 Preparatory Work

Before analysing all items and the last two variables about the personal background of the respondents, we reorganised all items into an ascending positive scale. Thus, a positive feeling about the impact of technology always corresponds to a higher numeric value (i.e., 5 in our case), while a negative opinion corresponds to a lower numeric value (here 1).

Variables as such as “Gender” or “Occupation” are nominal variables because it is possible only to distinguish respondents by a particular feature. Variables such as “Education” or the items in Likert format are ordinal variables because it is possible to sort respondents by the quantity of a certain characteristics they have. Variables such as “Age” are continuous variables because it is possible not only to sort respondents on the basis of a feature but also to individualise a fixed distance between two of them on the scale. The types of variables allowed us to choose the most appropriate kind of analysis.

All the statistical analyses presented in this report were produced with SPSS 13.0.

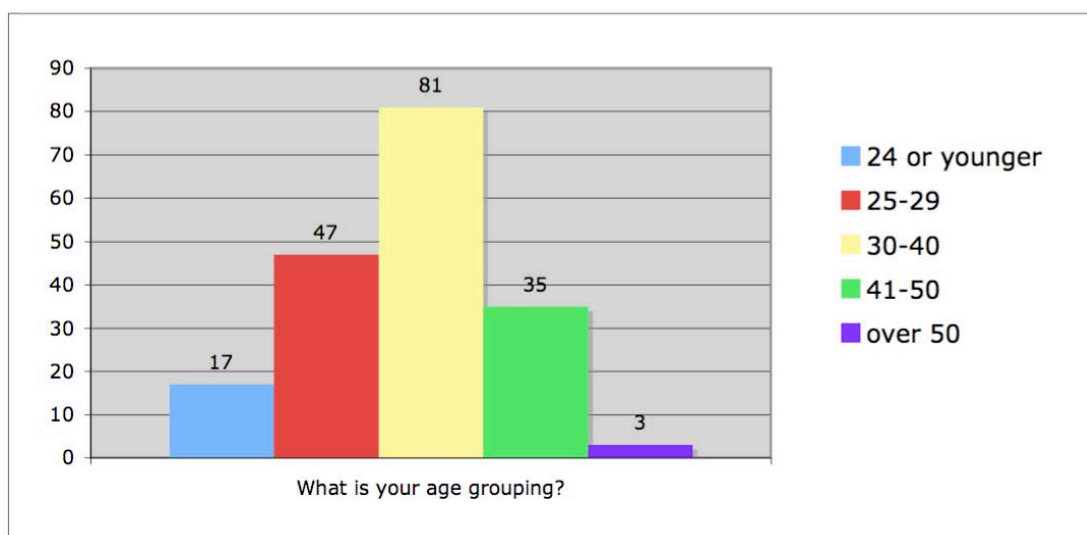

## 4.2 Descriptive Statistics of the Intervention Group

The results of the descriptive analysis are discussed in the following subsections according to the three sections of the questionnaire:

### 4.2.1 Personal Background

The majority of the distance students questioned are in technical positions (47), followed by those in a manager position (36), while the other three categories (teacher or trainer, student and unemployed) range between 15 and 16. Under the correction described in Section 3.1 category “Technical” would nearly double, “manager” and “teacher or trainer” remained stable and the others would only slightly grow.

As Fig. 5 illustrates, the mean age of the intervention group is somewhere slightly above 30.

**Figure 5: Age distribution of intervention group**

More than half of the respondents acquired a high school matriculation, 30 people have mastered one to three years post-secondary education, 53 even more years.

An overwhelming majority of 131 had to change their way of working due to technical innovation and 12 of the respondents in this group had to change their way of working at least once.

### 4.2.2 The Impact of ICT on Learning in General

The items in the section of the questionnaire that asked for the impact of ICT on learning in general addressed both general impressions and more specific attributes like the intensity of contacts and communication between teachers and students, benefits for disabled students, encouragement for active participation or more individualized learning programmes.

Communication technologies support synchronous and asynchronous variants of communication that differs from face-to-face communication due to particular para-lingual char-

## Final Report of WP 3

acteristics like volume and height of voice or non-verbal means of communication like gestures and facial expressions, which help to reduce misunderstandings (Schröder, Wankelmann; 2002).

More than half of the respondents believe that the problems of access to learning for students with disabilities has been resolved, 12 even strongly agree, only 54 are uncertain, 18 disagree and 3 strongly disagree. A different picture is drawn when the intensity of contacts between students and teachers in a face-to-face situation and in online education are equated: more people disagree or even strongly disagree with this argument than people agree or strongly agree (58 versus 87) and the number of respondents who are uncertain is relatively high with 38 people. The contribution of online communication to the increase of communication between teachers and students shows a slightly positive attitude with 84 people agreeing or strongly agreeing but only 48 (strongly) disagreeing. The uncertainty on this item is relatively high with 51 responses. The negatively formulated Item 10 “Only optimistic people think that the impact of technology on learning is beneficial” supports the positive perception of the impact of technology on learning with 120 (strong) disagreements. This impression is even enforced with 150 positive answers to Item 11, which addresses personal experiences. This positive attitude towards the impact of technology on learning is a bit weaker when asked for encouragement of students to become more involved in the educational process. 94 are still positive, only 25 are negative about this issue but 64 are uncertain. A positive attitude is also visible about the development of higher level thinking skills and more individualized learning programmes but the number of uncertain respondents reaches nearly one third of the sample. A relatively strong agreement can be found on the impression that learning is enhanced when multimedia components are integrated in the learning content (see Fig. 6). The motivating factor of educational games is also perceived positively but 52 respondents are uncertain, which probably derives from the fact that they have no such experience, and 33 are rather negative minded.

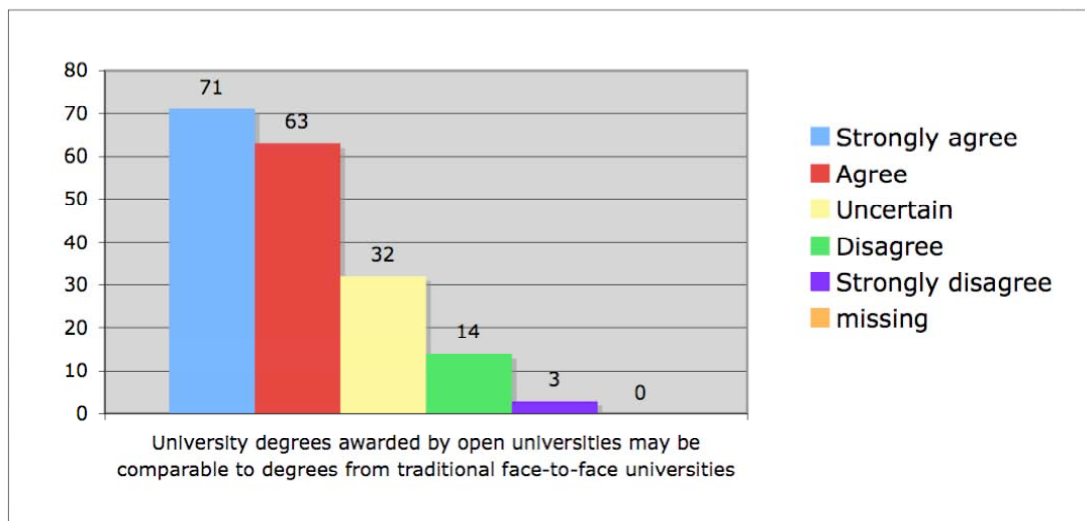

**Figure 6: The positive impact of multimedia environments on learning**

#### 4.2.3 The Impact of ICT on Learning in Open and Distance Universities

The third section of the questionnaire especially looked at perceptions and opinions about the impact of ICT on learning in open and distance universities. This group of 5 items addressed issues like:

- improved student administrative processes,
- easier access to material for part-time study,
- views about the statements that studying at a distance university and a face-to-face university and awards granted by both systems are of the same standard and
- the assessment of a foundational argument for open and distance universities, namely that they are especially advantageous for working professionals and adults with family obligations.

The improvement factors are largely confirmed with a higher value on the strong agreement and only around 7% of the samples being uncertain. Disagreement is neglectable with 3 and 7. That degrees awarded by traditional face-to-face universities and open universities compare is also seen positively with a slightly higher value in uncertain and negative judgements (see Fig. 7). With respect to the learning outcomes of systems, agreements and strong agreements predominate with 85 samples as opposed to 37 disagreements, but the uncertainty factor is quite high with 61 samples. That the study at an open or distance university is especially of advantage to adults who have work and family obligations proves politicians who supported the instalment of these institutions in the 1970s and 1980s to have taken the right decision with a strong agreement by 165 samples and 14 additional agreements.

**Figure 7: Degrees awarded by face-to-face and open universities are largely considered to be of equal standard**

### 4.3 Descriptive Statistics of the Control Group

We adopt the structure of discussion in the previous section with three subsections.

### 4.3.1 Personal Background

The samples of the control group are mainly occupied in educational positions as teachers, trainers or students (125). Management positions are occupied by 30 persons, technical staff are 11 and unemployed are 8 people. Two did not provide an answer to this question. The age of the population spreads as follows: 43 respondents are 24 or younger, 43 are between 25 and 29 years old, 39 are in the thirties, 29 in the forties and 22 over 50. Female participants are dominant with 108 to 66 male in the control group. The level of education shows 79 with high school matriculation, 37 with up to 3 years and 57 with three years and more post-secondary education. The majority of respondents had to adapt to advanced technological equipment once or more (17 and 100, respectively) but about one third did not experience this.

### 4.3.2 The Impact of ICT on Learning in General

Opinions about the claim that access to learning in general for students with disabilities is resolved is shared by nearly half of the sample but about one third are uncertain and 28 disagree. Only 37 respondents accept the claim that the intensity of contacts in face-to-face and online education is comparable. 19 are uncertain and a large majority of 117 persons objects this position. A somewhat larger group of respondents is convinced that online communication mechanisms have contributed to intensify communication between teachers and learners but still a substantial portion is uncertain or doubts that claim (see Fig. 8).

**Figure 8: Online communication has intensified interaction between teachers and students**

The negatively formulated Item 10 did not mislead the group as more than 100 respondents objected to it, which confirms their mainly positive opinion about the impact of ICT on learning in general. This is enforced by 148 positive answers to the positive formulation of this position under the impression of personal study experiences (Item 11). The claim that ICT in education encourages the active participation of students is viewed positively as well but still 50 respondents are uncertain and 28 disagree. A similar picture is drawn by the answers to claims that ICT has been used to support the development of more demanding cognitive processes that allow students to evaluate a subject matter or create something new by combining elements to a coherent and functioning whole. The

### Final Report of WP 3

support of the claim that ICT has been used to tailor learning programmes to individual needs is even higher and more so is the agreement to the claims that “learning is enhanced when text and pictures are integrated in a multimedia environment” and “educational game motivate learners and promote the development of social skills.

#### 4.3.3 The Impact of ICT on Learning in Open and Distance Universities

In interesting observation related to this group of items is the relatively high number of more than 20 missing answers here, whereas the range is below 5 otherwise.

Overwhelming is the agreement here to the claim that new ICT concepts have improved distance education and related student administrative processes. Attitudes to the claim that technology facilitates access to material for part-time students are even more supportive on this item with 97 strong agreements and 45 agreements against 9 uncertain positions and 3 disagreements. The answers to the statement about the comparability of degrees awarded from traditional face-to-face and from open or distance universities shows a high degree of uncertainty in this group with a slight tendency to disagree (see Fig. 9).

**Figure 9: Control group's judgement of the comparability of degrees (see also Fig. 6)**

A similar profile depicts the graph of opinions about the learning outcomes between an open and a face-to-face university. Finally we observe an extremely high agreement, even strong agreement, with the claim that “study at an open university is especially of advantage to adults who have work and family obligations.

## 4.4 Variance between Intervention and Control Group

We applied cross-tabulation to find out whether differences exist between the two different groups of people in our sample. The totality of cross-tables relating to the two study groups is presented in Annex B.3.

## Final Report of WP 3

**4.4.1 Personal Background**

In the control group we find a similar number of people in a managerial position in both groups but far less technical employees in the control group (see Table 1). The control group has also more teachers and students.

**Table 1: Distribution of occupations in both groups**

		Main group/Control group		Total
		Main group	Control group	
What is your occupation?	Manager	36	30	66
	Technical	47	11	58
	Teacher or Trainer	16	66	82
	Student	16	59	75
	Unemployed	15	8	23
	Other (e.g. retired)	53	0	53
Total		183	174	357

The age distribution is also different in both groups with a relatively homogeneous distribution among all age categories in the control group, whose mean age is also lower than in the intervention group (see Fig. 10).

With 42 more female than male respondents the gender distribution is a little less balanced in the control as opposed to the intervention group. The differences between the two groups in this variable are visualized in the bar chart in Fig. 8. These differences are visible in the bar chart and tables we generated but also supported by the Chi-Square test presented on pages 3-5 of Annex B.3.

**Figure 10: What is your age group?**

### Final Report of WP 3

The graphs illustrating the level of education, experiences in the use of advanced technology and the need to adapt to new technology, have a quite congruent shape with slightly different numbers for the first two aspects (see Annex B.3, page 6-8). A significant difference exists, however, with respect to the need to adapt to advanced technological equipment. Pearson Chi-Square computes a significant difference with a value of 0.029. This could be explained by the fact that the intervention group includes relatively more technical employees and that the mean each in that group is somewhat higher.

#### **4.4.2 The Impact of ICT on Learning in General**

The bar charts and tests in Annex B3, pages 9-18, present the results for items 7-16 of the questionnaire. The following observations can be made in the comparison of the two groups:

- The statement that problems of access to learning for students with disabilities have been resolved (Item 7, page B3-9) is viewed rather positively in the intervention group, while agreement and uncertainty have a higher share in the control group and their values are nearly balanced. The higher degree of agreement in the intervention group could lie in the fact that distance students perceive the use of ICT more than others as a means to bridge the physical distance between learners, lecturers and tutors.
- The attitude of the respondents to Item 8 (B3-10) that contacts between students and teachers can have the same intensity in online education as in face-to-face education is rather negative in both groups with a significantly more positive trend in the intervention group. Again different experiences of distance students with respect to limited contact options in the past may have caused this difference.
- As to Item 9, which states that online communication allows increased amounts of communication between teachers and students when compared with other forms of education, the degree of uncertainty is significantly lower in the control group than in the intervention group, the opinions are, however, relatively equally distributed between agreement and rejection (B3-11). Here it is likely that participants in the control group are easier in finding an opinion cause they – other than many distance students – have experienced themselves other forms of education.
- The negatively formulated Item 10 about the benefits of technology for learning is negated in both groups by a majority of respondents (i.e., the benefits are recognised). But a significantly higher negation can be observed in the intervention group (B3-12).
- The opinions to Item 14 that ICT has been used to support individualized learning programmes and Item 16 that educational games motivate learners are slightly more positive in the intervention group. It could well be that ICT applications are viewed as additional offers and a supplement to other educational methods in the control group, while the intervention group considers them rather as a replacement for traditional forms of distance education.

#### **4.4.3 The Impact of ICT on Learning in Open and Distance Universities**

In the third group of items again we find great similarities in both groups concerning the assessment of the stated improvement of distance education due to ICT in learning and

## Final Report of WP 3

administrative process. Facilitated access to material is rated similarly in both groups as well and Pearson's chi-square indicates no significant difference in attitude.

**Figure 11: University degrees awarded by open universities are comparable to degrees from traditional face-to-face universities**

A striking difference shows up in the respondents' opinion about the comparability of degrees awarded by face-to-face and distance universities (Item 19): The control group is much less certain in this aspect than the intervention group, as can be seen in Fig. 11. More than 42% of this group are uncertain, while agreement and disagreement are nearly balanced. The intervention group shows a significantly higher agreement. Pearson's chi-square test as shown on page 21 of Annex B.3 supports this observation. The level of disagreement in uncertainty in the control group is nearly twice as high as in the intervention.

Analogous differences result with respect to the quality of learning outcomes in both systems (Item 20) but here in both groups also shows differences in the distribution among the five answer categories, which is also stressed by the chi-square test (Annex B.3, page 22). Finally there is also a bit more doubt about the specific advantage of the distance study system in the control group than in the intervention group. This can probably be explained by the lack of experience of the participants in the control group.

The close relationship between these questions is not only supported by similar intentions and similar response tendencies in both groups but also by Spearman's correlation test (0.614).

The agreement to Item 21 (Study at an open university is especially of advantage to adults who have work and family obligations) is overwhelming. In the intervention group the agreement is even significantly higher.

## Final Report of WP 3

## 4.5 T-Test

The t-test applied to our two sample groups allows us to compare the means of both groups. Table 2 presents these values. Higher values are given in red. Rows with a green background emphasise variables whose values differ significantly. Independent sample tests that were computed as well are appended in Annex B.4.

**Table 2: Comparing the means of intervention and control group**

Item	Main group				Control group			
	Valid	Missing	Mean	Range	Valid	Missing	Mean	Range
Only optimistic people think that the impact of technology on learning is beneficial	183	0	3.72	4	174	2	3.4	4
From my personal study experience I find that the impact of technology on learning is valuable	183	0	4.12	4	174	2	4.1	4
Information and communications technology has usually been used to encourage us to be active participants in learning	183	0	3.44	4	174	2	3.48	4
Information and communications technology has been used to support the development of higher level thinking skills such as synthesis and problem solving	183	0	3.36	4	175	1	3.42	4
Information and communications technology has been used to support more individualized learning programmes tailored to our own individual needs	183	0	3.37	4	172	4	3.65	4
Learning is enhanced when text and pictures are integrated in a multimedia environment	183	0	4.05	4	174	2	4.18	4
Educational games motivate learners and contribute to developing skills such as teamwork	183	0	3.46	4	173	3	4.06	4
The application of new ICT concepts to support learning and teaching and provide Internet access to student administrative processes, has improved distance education	183	0	4.42	3	153	23	4.06	4
Technology facilitates easier access to material for those studying part-time	183	0	4.38	4	154	22	4.53	3
University degrees awarded by open universities may be comparable to degrees from traditional face-to-face universities	183	0	4.01	4	153	23	2.97	4
There is no difference in learning outcomes between studying at an Open University or at a traditional face-to-face university	183	0	3.44	4	152	24	2.77	4
Study at an Open University is especially of advantage to adults who have work and family obligations	183	0	4.86	4	154	22	4.44	4
Thanks to technology, the problems of access to learning for students with disabilities have been resolved	183	0	3.52	4	176	0	3.41	4
Contacts between students and teachers can have the same intensity in online education as in face-to-face education	183	0	2.84	4	173	3	2.37	4

Final Report of WP 3

Online communication allows increased amounts of communication between teachers and students when compared with other forms of education	183	0	3.29	4	174	2	3.22	4
--	-----	---	------	---	-----	---	------	---

## 5 CROSS-TABULATION OF PERSON BACKGROUND AND TECHNOLOGY-RELATED VARIABLES

Cross-table analysis was performed to study the relationship between personal background variables like age, gender, occupation etc. and opinions about the use of technology in higher education, in general, and education at open and distance universities, in particular. Cross tabulations helps us to study the relationships between nominal and ordinal variables.

Variables as such as “Gender” or “Occupation” are nominal variables because it is possible only to distinguish respondents by a particular feature. Variables such as “Education” or the items in Likert format are ordinal variables because it is possible to sort respondents by the quantity of a certain characteristics they have. Variables such as “Age” are continuous variables because it is possible not only to sort respondents on the basis of a feature but also to individualise a fixed distance between two of them on the scale. These types of variables allowed us to choose the most appropriate kind of analysis.

Before analysing all items and the last two variables about the personal background of the respondents were reorganised into an ascending positive scale. Thus, a positive feeling about the impact of technology always corresponds to a higher numeric value (i.e., 5 in our case), while a negative opinion corresponds to a lower numeric value (here: 1).

The results of these analyses are selectively presented in the following subsections. A summary table for the answers in each of the remaining items is also included as well as Chi-square tests and comparison bar charts, some of which are shown in the main text to follow. All statistical analysis data are presented in detail in Annexes B.5 to B.8.

The Chi-Square gives us a measure of the statistical significance or probability value and tests the hypothesis that the row and column variables are independent or unrelated to one another. To be able to say that a relationship is statistically significant, the p-value needs to be as small as possible. The value used is less than 0.05 (confidence level of 95%). In the tables, it is therefore necessary to inspect the “Pearson Chi-Square “ row in the “Asymp. Sig.” column. If the p-value is less than 0.05, this means that there is a low probability that the differences we have found are due to chance.

### 5.1 Influence of Age on Peoples Opinions

The extent to which our respondents have used advanced technological equipment in their professional life is indifferent with respect to variable age.

Tables 3 illustrates that people in the age of 30-50 have more frequently changed their way of working because of technological developments than users below the age of 30. The A-Sig. value of the Pearson chi-square test shown in Table 4 indicates significance with 0.01 below significance level.

## Final Report of WP 3

**Table 3: Have you had to change your way of working because of technological developments?**

			What is your age		Total
			41-50	over 50	
Have you had to change your way of working because of technological developments?	Yes, more than once	Count	49	19	231
		Expected Count	40,3	16,3	231,0
	Yes. Once	Count	6	3	29
		Expected Count	5,1	2,0	29,0
	No	Count	7	3	95
		Expected Count	16,6	6,7	95,0

Item “Thanks to technology, the problems of access to learning for students with disabilities have been resolved” shows a big difference for respondents under the age of 24 as opposed to respondents in the age range 25 to 29. The former have a more negative attitude while people in the age range between 25 and 29 have a more positive attitude (see Fig. 12).

**Figure 12: Thanks to technology, the problems of access to learning for students with disabilities have been resolved**

## Final Report of WP 3

For positions to the claims:

- *“Contacts between students and teachers can have the same intensity in the education as in face-to-face education”,*
- *“Online communication allows increased amounts of communication between teachers and students when compared with other forms of education”,*
- *“Only optimistic people think that the impact of technology on learning is beneficial” and*
- *“From my personal study experience I find that the impact of technology on learning is valuable”*

no significance with respect to the age of the respondents could be shown (see also Annex B.5, Pages 10-16).

For Item 12 of the questionnaire more users under the age of 24 or younger believe that *“Information and communication technology has usually been used to encourage us to be active participants in learning”* (see Table 5 below and Annex B4, pages 17 and 18).

**Table 5: ICT has usually been used to encourage us to be active participants in learning**

			What is your age grouping?		
			24 or younger	25-29	30-40
Information and communications technology has usually been used to encourage us to be active participants in learning	Strongly disagree	Count	0	2	3
		Expected Count	,8	1,2	1,7
	Disagree	Count	6	15	13
		Expected Count	8,1	12,0	16,0
	Uncertain	Count	18	27	41
		Expected Count	19,2	28,4	38,0
	Agree	Count	22	41	55
		Expected Count	26,7	39,6	53,0
	Strongly agree	Count	14	4	7
		Expected Count	5,2	7,7	10,3
Total	Count	60	89	119	
	Expected Count	60,0	89,0	119,0	

More users under the age of 25 believe that:

- *Information and communication technology has been used to support the development of higher level thinking skills such as synthesis and problem solving and*
- *Information and communication technology has been used to support more individualized learning programs tailored to our own individual needs.*

But Pearson's chi-square test shows no significant difference in the second case, only in the first (see also Annex B.5, pp. 20-22).

The assessments of the statements:

- *Learning is enhanced when text and pictures are integrated in a multimedia environment and*
- *Educational games motivate learners and contribute to developing skills such as teamwork*

are insignificant with respect to variable age (Annex B.5, pp. 23-26).

## Final Report of WP 3

That “the application of new ICT concepts to support learning and teaching and provide Internet access to student administrative processes, has improved distance education” is true is believed by more respondents in the age between 30 to 40 than other age groups (see Fig. 13 and Annex B.5, p. 28).

**Figure 13: The application of new ICT concepts to support learning and teaching and provide Internet access to student administrative processes, has improved distance education**

Responses to the claim: *Technology facilitated easier access to material for those studying part-time* are independent of variable age.

Users under the age of 30 have a more negative attitude than users at the age 30-50 towards the assertions:

- *University degrees awarded by open universities may be comparable to degrees from traditional face-to-face universities and*
- *There is no difference in learning outcomes between studying at an Open university or at a traditional face-to-face university*

(See also Fig. 14 and Annex B.5, pp. 31-34.)

## Final Report of WP 3

**Figure 14: University degrees awarded by open universities may be comparable to degrees from traditional face-to-face universities**

That the study at an Open University is especially of advantage to adults who have work and family obligations is rated independently of the age group.

## 5.2 Influence of Gender

The complete results of the cross-tabulation of variable Gender with the technology related items are presented in Annex B.6. In the section we only discuss those items that show a significant dependence of the gender of the respondents.

**Fig. 15: Thanks to technology, the problems of access to learning for students with disabilities have been resolved**

## Final Report of WP 3

Our study reveals that:

- more male than female respondents *use advanced technological equipment in their professional life* (Item 5);
- more female respondents believe that *the problems of access to learning for students with disabilities have been resolved thanks to technology* (Item 7, see Fig 14);
- more female respondents believe that *online communication allows increased amounts of communication between teachers and students when compared with other forms of education* (Item 9);
- more female respondents believe that *ICT has usually been used to encourage us to be active participants in learning* (Item 12);
- more female respondents are convinced that *educational games motivate learners and contribute to developing skills such as teamwork* (Item 16); and, finally,
- more female respondents strongly agree that *the application of new ICT concepts to support learning and teaching and provide Internet access to student administrative processes, has improved distance education* (Item 17).

In summary, it seems that females have a more positive attitude toward the impact of ICT on learning in both traditional face-to-face and distance education.

### 5.3 Influence of Level of Education

Again, the influence of the level of education on the respondents' attitudes will be discussed only when a significant.

The complete set of analysis results is detailed in Annex B.7.

**Fig. 16: ICT has usually been used to encourage us to be active participants in learning**

Significant dependencies on the level of education we detected include:

- more people with high school matriculation than others strongly believe that *information and communication technology has usually been used to encourage us to be active participants in learning* (Item 12, see also Fig. 16);
- the same group is also more positive than others about the claim that *information and communication technology has been used to support the development of higher level thinking skills such as synthesis and problem solving* (Item 13).

## 5.4 Influence of Occupation

The following dependencies have been detected:

- Managers and technical staff, somewhat less students as well, use more *advanced technological equipment in their professional life* than other groups (Item 5);
- Students have a more negative attitude to believe that *the problems of access to learning for students with disabilities have been resolved thanks to technology* (Item 7);
- Manager and retired persons have a more positive attitude than teachers and students towards Item 8 (*contacts between students and teachers can have the same intensity in online education as in face-to-face education*);
- Managers and teachers are more positive than technical staff and students about the claim (Item 9): *Online communication allows increased amounts of communication between teachers and students when compared with other forms of education* (see also Table 6);
- Students have a more positive attitude than managers concerning the statement (Item 10): *Only optimistic people think that the impact of technology on learning is beneficial*;
- *Information and communication technology has usually been used to encourage us to be active participants in learning* (Item 12) believe teachers and students more than other occupational groups;
- the same groups are also more positive than others about the statement in Item 13: *ICT has been used to support the development of higher level thinking skills such as synthesis and problem solving*;
- Teachers and students also believe more than other occupational groups that *educational games motivate learners and contribute to developing skills such as teamwork* (Item 16);
- Teachers have a more positive attitude than students against the claim (Item 17): *The application of new ICT concepts to support learning and teaching and provide Internet access to student administrative processes, has improved distance education*;
- Teachers and technicians are more positive than students about Item 18: *Technology facilitates easier access to material for those studying part-time*;

## Final Report of WP 3

- University degrees awarded by open universities may be comparable to degrees from traditional face-to-face universities (Item 19) is viewed more negatively by teachers and students than by retired people; finally,
- Students are a bit more pessimistic that the Study at an Open University is especially of advantage to adults who have work and family obligations.

**Table 6: Online communication allows increased amounts of communication between teachers and students when compared with other forms of education**

			What is	Total
			Other (e.g. retired)	
Online communication allows increased amounts of communication between teachers and students when compared with other forms of education	Strongly disagree	Count	1	17
		Expected Count	2,5	17,0
	Disagree	Count	12	89
		Expected Count	13,3	89,0
	Uncertain	Count	7	77
		Expected Count	11,5	77,0
	Agree	Count	22	131
		Expected Count	19,6	131,0
	Strongly agree	Count	11	41
		Expected Count	6,1	41,0
Total	Count	53	355	
	Expected Count	53,0	355,0	

## 6 SPEARMAN'S RHO CALCULATION

To determine the linear relationship between different variables, we also applied Spearman's rank correlation coefficient as a non-parametric measure of correlation. This coefficient allows us to correlate two ordinal variables.

In the analysis, we applied it to all the items. It gives us the direction of the relationship (positive or negative) and its strength. The significant values have a flag in the table presented Annex B.9. The strength of the coefficient is interpreted according to (Muij, 2003, p. 145):

0. +/- 1	weak
0. +/- 3	modest
0. +/- 5	moderate
0. +/- 8	strong
over 0. +/- 8	very strong

The direction of the correlation indicates whether both variables increase their values (positive) or one increases when the other decreases (negative).

It is important to remember that the fact that two variables are related to one another does not necessarily mean that one is the cause of the other. Furthermore, the Spearman's Rho is a rank-order coefficient for ordinal variables. This means that when we use the terms "to increase/decrease" or "more/less" we are not referring to proper measurable "quantities" on a continuous scale, but only to a higher or a lower position in a rank-order.

Therefore, the most relevant results of the analysis are the following:

The answers to the questions about the "*impact of information and communications technologies (ICT) on learning in general*" (items 7-16) are – as far as the answers are significant – positively correlated. For items 11 to 16 even a positively moderate correlation was found significant for each combination of items. Whoever had a positive attitude towards at least one claim about the impact of ICT on learning, exhibited a positive tendency towards the other items, too.

The following correlations are of particular interest:

- An agreement to the claim "*contacts between students and teachers can have the same intensity in online education as in face-to-face education*" (item 8) is moderately positively correlated an agreement to the claim in item 9 "*online communication allows increased amounts of communication between teachers and students when compared with other forms of education*" ( $\rho = 0.454$ ; Sig. = 0.000).
- Respondents who agree based on their personal experience with the statement that "*the impact of technology on learning is valuable*" (item 11) also tend to support the thesis of item 15 that "*learning is enhanced when text and pictures are integrated in a multimedia environment*" ( $\rho = 0.327$ ; Sig. = 0.000).
- Responses to item 12 "*ICT has usually been used to encourage students to be active participants in learning*" and item 13 "*ICT has been used to support the development of higher level thinking skills such as synthesis and problem solving*" are moderately positively correlated ( $\rho = 0.396$ ; Sig. = 0.000).

## Final Report of WP 3

- Answers to item 15 that *“learning is enhanced when text and pictures are integrated in a multimedia environment”* are moderately positively correlated to answers to item 16, which states that *“educational games motivate learners and contribute to developing skills such as teamwork”* ( $\rho = 0.317$ ; Sig. = 0.000).

We also found moderately positive correlations between the answers to the items in section *“impact of ICT on learning in open and distance universities”* of the questionnaire (items 17-21), provided significance was provable:

- Responses to the claim that *“university degrees awarded by open universities may be comparable to degrees from traditional face-to-face universities”* (item 19) and the claim that *“there is no difference in learning outcomes between studying at an Open University or at a traditional face-to-face university”* (item 20) are strongly, i.e., for the respondents a comparable degree coincides with an undistinguishable study success ( $\rho = 0.614$ ; Sig. = 0.000).
- The agreement with the idea that *“technology facilitates easier access to material for those studying part-time”* (item 18) is moderately positively correlated to an agreement with item 17 that *“the application of new ICT concepts to support learning and teaching and provide Internet access to student administrative processes, has improved distance education”* ( $\rho = 0.443$ ; Sig. = 0.000).
- The responses to items 17 that *“the application of new ICT concepts to support learning and teaching and provide Internet access to student administrative processes, has improved distance education”*, item 18 that *“technology facilitates easier access to material for those studying part-time”*, and item 19 that *“university degrees awarded by open universities may be comparable to degrees from traditional face-to-face universities”* are moderately positively correlated to the agreement with item 21 that the *“study at an Open University is especially of advantage to adults who have work and family obligations”* ( $\rho = 0.358$ ,  $\rho = 0.336$ , and  $\rho = 0.328$ , respectively, with Sig. = 0.000 in all cases).

Significant results provided, we also only found moderately positively correlated answers to items in the groups *“impact of ICT on learning in general”* (items 7-16) and *“impacts of ICT on learning at open and distance universities”* (items 17-21). However, an exception was the correlation between the responses to item 16 *“educational games motivate learners and contribute to developing skills such as teamwork”* and item 19, which says that *“university degrees awarded by open universities may be comparable to degrees from traditional face-to-face universities”*. The answers to these two items are the only moderately negatively correlated statements about the impacts of ICT among each other ( $\rho = -0.120$ ; Sig. = 0.029). Respondents who consider educational games as motivating rather negate the comparability of degrees awarded by open universities and traditional face-to-face universities.

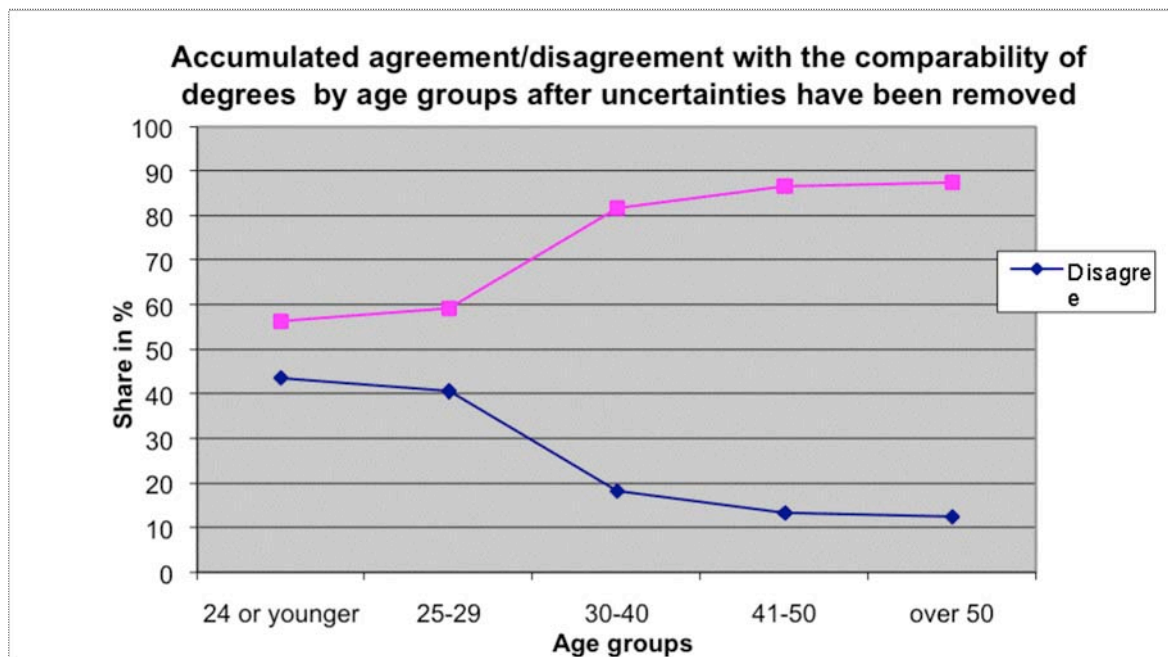

Another observation related to these two item groups includes:

- The agreement to item 9 *“online communication allows increased amounts of communication between teachers and students when compared with other forms of education”* is moderately positively correlated to the agreement to item 19 *“university degrees awarded by open universities may be comparable to degrees from traditional face-to-face universities”* ( $\rho = 0.314$ ; Sig. = 0.000).

Conclusions about correlations between responses to impact items and age groups need to be drawn carefully. The results according to Spearman suggest the following observation:

## Final Report of WP 3

- The age grouping is moderately negatively correlated with the *frequency of change of the way of working due to technological developments* (item 6), i.e., older respondents showed more need for change because of technological innovations ( $\rho = -0.221$ ; Sig. = 0.000).
- The age grouping is moderately negatively correlated with the agreement to the idea that “*ICT has been used to support the development of higher level thinking skills*” (item 13), i.e., older respondents showed more agreement with this perspective ( $\rho = -0.215$ ; Sig. = 0.000).
- The age grouping is moderately positively correlated with the agreement to the idea that “*university degrees awarded by open universities may be comparable to degrees from traditional face-to-face universities*”, i.e. younger respondents showed more agreement with this comparison ( $\rho = -0.212$ ; Sig. = 0.000).
- The age grouping is moderately positively correlated with the agreement to the idea that *studying at an Open University is especially of advantage to adults who have work and family obligations*, i.e., younger respondents showed more agreement with this assumption ( $\rho = -0.203$ ; Sig. = 0.000).

**Fig. 17: Attitudes towards the comparability of degrees awarded by open universities and traditional face-to-face universities**

Let us look closer at the second but last conclusion, which is also visualised in Fig. 17:

The computation of correlations according to Spearman yields the following result: the younger the respondents are, the higher is the agreement with item 19, namely that “*university degrees awarded by open universities may be comparable to degrees from traditional face-to-face universities*”. However, if we compare the relative agreement or disagreement about the comparability of degrees broken down to age groups, not considering indifferent responses, exactly the opposite result can be deduced. We presume that Spearman’s  $\rho$  calculation produces a different result because of a relatively high amounts of respondents beyond 50 who have no opinion to this item (more than 50% of this age group

### Final Report of WP 3

are indifferent with just 17 participants, while the other age groups only exhibit 22.4% - 32.8% indifferent positions on this item).

Even though Spearman's calculation suggests a significantly moderate correlation, we suspect that it is strongly influenced by the age group over 50 and we assume that other observations would result if this group would be left out in the computation.

The pure data analysis of this test is shown in Annex B.9.

## 7 FREQUENCIES

We have also calculated the count for each variable considering the answers of all respondents.

Figure 17 just depict the frequencies for Item 5. The complete computation result is presented in Annex B.10 including counts, percentages and further bar charts.

**Fig. 18: To what extent have you used advanced technological equipment in your professional life?**

Some insights into these data are summarised below:

- most participants (more than 80%) *frequently use advanced technological equipment in their professional life*;
- a large percentage of respondents (more than 70%) have experienced that they *needed to change their way of working because of technological advances*;
- 50% of the sample believes that *the problems of access to learning for students with disabilities have been resolved thanks to technology*, as opposed to only a small portion (around 10%) that disagrees.
- nearly 60% disagree with the claim that *contacts between students and teachers can have the same intensity in the education as in face-to-face education*, but only around 30% agree with it.
- nearly half of the sample agrees that *online communication allows increased amounts of communication between teachers and students when compared with other forms of education*, while around 30% disagree with this statement;
- nearly 60% disagree with the negative statement that *only optimistic people think that the impact of technology on learning is beneficial* and only around 20% agree;

## Final Report of WP 3

- a large portion of samples (nearly 80%) agrees *based on personal study experiences* that *the impact of technology on learning is valuable for their personal study*.
- more than half of the population agrees that *information and communication technology has usually been used to encourage us to be active participants in learning* with only a small portion (around 15%) disagreeing;
- more than 50% agree that *ICT has been used to support the development of higher level thinking skills such as synthesis and problem solving*, while only around 20% disagree with this;
- again more than 50% agree that *ICT has been used to support more individualized learning programs tailored to our own individual needs*, around 20% disagree;
- a majority of respondents (around 80%) agree that *learning is enhanced when text and pictures are integrated in a multimedia environment*;
- around 70% agree that *educational games motivate learners and contribute to developing skills such as teamwork*;
- most users (approx. 75%) agree that *the application of new ICT concepts to support learning and teaching and provide Internet access to student administrative processes, has improved distance education*;
- nearly all respondents (around 90%) agree that *technology facilitated easier access to material for those studying part-time*;
- around 50% agree that *university degrees awarded by open universities may be comparable to degrees from traditional face-to-face universities*; disagreement ranges at 25%;
- no agreement can be determined on the claim: *There is no difference in learning outcomes between studying at an Open university or at a traditional face-to-face university*;
- that *the study at an Open University is especially of advantage to adults who have work and family obligations is shared*, however by an overwhelming percentage of respondents (around 90%).

## 8 VARIANCE ANALYSIS (ANOVA)

The analysis of variances (ANOVA) allows us to compare the mean score of an ordinal variable (with many scale points) between different groups. The analysis works by comparing the spread (variance) of the group means with the spread of values within the groups.

In ANOVA we can use one or more independent variables but they all have to be nominal or ordinal. If the independent variables have more than five groups, ANOVA quickly starts to lose its power to discriminate between them.

ANOVA uses a test (the F-test) to determine whether there are significant differences between the means of the groups. A cut off point of  $< 0.05$  used as a rule of thumb to determine whether or not our relationship is significant. The F-test is a global test, which means that if we find a significant difference (p-value  $< 0.05$ ), all we know is that overall there is a significant difference somewhere in the comparisons between the groups (Muijs, 2003, p. 185-200).

The test we used here to find out which comparisons are significantly different is the Scheffe test. A significance level (p-value) is calculated for each test. For example, in the document in Annex B.11, we have a significant p-value from the F-test for the question “*Contacts between students and teachers can have the same intensity in online education as in face-to-face education*” (value  $0.015 < 0.05$ ). This means that we have a significant difference somewhere between the groups. As we can see in the Post Hoc Tests, in the row of the same question at the column labelled ‘Sig.’, we have a p-value of 0.036, which means that it is highly significant; so it is likely that the associated group (41-50) differ significantly from the age group 25-29.

Another, more significant example could be the one related to the question “*Information and communications technology has been used to support the development of higher level thinking skills such as synthesis and problem solving*”: here the group 24 and younger is significantly different from all the others groups.

Annexes B.11-B13 presents the results of the ANOVA test applied to variables Age, Education and Occupation, respectively.

## 9. CONCLUSIONS

This study has confirmed that it is generally accepted that the use of technology in higher distance education is beneficial for the student population at large and for special needs students in particular. We found that there is no significant difference in the judgement of participants with or without experience in learning at an open or distance university that the use of technology in distance education can overcome several disadvantages of this study model including impeded interaction between tutors and students, indirect communication, or reduced opportunities for social interaction. A large majority of participants in the study agrees that ICT facilitates easier access to material for those studying part-time (90%) and the application of ICT to support learning and teaching and providing Internet access to student administrative processes has improved distance education (75%). Multimedia environments are considered to provide a high benefit for teaching and learning in open and distance universities. 80% of the population agrees that learning is enhanced when text and pictures are integrated in a multimedia environment. On the contrary, while still being the majority, only 50% participants agree that ICT was used to provide individualized learning programmes.

Our hypotheses that it is generally accepted that the education provided by open university compares with that of campus universities and the degrees awarded by open universities are equally well recognized as those awarded by traditional campus universities was not fully confirmed. While most participants (90%) believe that study at an Open University is especially advantageous to adults who have work and family obligations, the study quality at such institutions has not been well recognized. Among the participants, no agreement has been reached on whether there is a difference in learning outcomes between studying at an Open University or at a traditional face-to-face university. Although a small majority of participants supports the claim that university degrees awarded by open universities are comparable to degrees from traditional face-to-face universities, it is important to notice that the negative opinions mainly came from teachers and students. In particular, participants under 30 have a more negative attitude as opposed to participants in the age category 30-50. Further research would be required to ascertain if this is down to personal experience as younger people are more inclined to attend conventional universities. In any case open and distance universities seem to have a marketing problem with respect to the quality of the degrees they award.

## Final Report of WP 3

## ANNEXES

### A.1 Multiple Language Version of the Questionnaire used in WP3

The original English questionnaire “*Impact of technology on learning in Open Universities, distance education systems both academic and corporate*” was translated in the languages of the intervention and control groups.

#### A.1 English original

##### Personal background

1. What is your occupation?
  - ☐ Manager
  - ☐ Technical
  - ☐ Teacher or trainer
  - ☐ Student
  - ☐ Unemployed
2. What is your age grouping?
  - ☐ 24 or younger
  - ☐ 25-29
  - ☐ 30-40
  - ☐ 41-50
  - ☐ over 50
3. Gender?
  - ☐ Male
  - ☐ Female
4. What is your level of education?
  - ☐ High school matriculation
  - ☐ One to three years of post-secondary education
  - ☐ Four or more years of post-secondary education
5. To what extent have you used advanced technological equipment in your professional life?
  - ☐ A lot
  - ☐ Quite a bit
  - ☐ Little
  - ☐ Very little
  - ☐ Not at all
6. Have you had to change your way of working because of technological developments?
  - ☐ Yes. More than once
  - ☐ Yes. Once
  - ☐ No

**Questions on the impact of information and communications technologies (ICT) on learning in general**

7. Thanks to technology, the problems of access to learning for students with disabilities have been resolved

- ☐ Strongly agree
- ☐ Agree
- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

8. Contacts between students and teachers can have the same intensity in online education as in face-to-face education

- ☐ Strongly agree
- ☐ Agree
- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

9. Online communication allows increased amounts of communication between teachers and students when compared with other forms of education

- ☐ Strongly agree
- ☐ Agree
- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

10. Only optimistic people think that the impact of technology on learning is beneficial

- ☐ Strongly agree
- ☐ Agree
- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

11. From my personal study experience I find that the impact of technology on learning is valuable

- ☐ Strongly agree
- ☐ Agree
- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

12. Information and communications technology has usually been used to encourage us to be active participants in learning

- ☐ Strongly agree
- ☐ Agree
- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

13. Information and communications technology has been used to support the development of higher level thinking skills such as synthesis and problem solving

- ☐ Strongly agree
- ☐ Agree

- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

14. Information and communications technology has been used to support more individualized learning programmes tailored to our own individual needs

- ☐ Strongly agree
- ☐ Agree
- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

15. Learning is enhanced when text and pictures are integrated in a multimedia environment

- ☐ Strongly agree
- ☐ Agree
- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

16 Educational games motivate learners and contribute to developing skills such as teamwork

- ☐ Strongly agree
- ☐ Agree
- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

### **Questions on the impact of information and communications technologies (ICT) on learning in Open Universities**

17. The application of new ICT concepts to support learning and teaching and provide Internet access to student administrative processes, has improved distance education

- ☐ Strongly agree
- ☐ Agree
- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

18. Technology facilitates easier access to material for those studying part-time

- ☐ Strongly agree
- ☐ Agree
- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

19. University degrees awarded by open universities may be comparable to degrees from traditional face-to-face universities

- ☐ Strongly agree
- ☐ Agree
- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

20. There is no difference in learning outcomes between studying at an Open University or at a traditional face-to-face university

- ☐ Strongly agree
- ☐ Agree
- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

21. Study at an Open University is especially of advantage to adults who have work and family obligations

- ☐ Strongly agree
- ☐ Agree
- ☐ Uncertain
- ☐ Disagree
- ☐ Strongly disagree

5. Мениджър; 4. Инженер или техник; 3. Преподавател или възпитател; 2. Студент;  
1. Безработен
- 2 Възрастовата ви група? 1 2 3 4 5
5. 24 или по-млад; 4. 25-29; 3. 30-40; 2. 41-50; 1. Над 50
- 3 Пол? 1 2
2. Мъж; 1. Жена
- 4 Ниво на образование? 1 2 3
3. Зачислен във висше училище; 2. Една до три години след-гимназиално (следдипломно?) обучение; 1. четири и повече години след-гимназиално обучение
- 5 До каква степен сте използвали модерно технологично оборудване във вашия професионален живот? 1 2 3 4 5
5. Много; 4. Достатъчно; 3. Малко; 2. Много малко; 1. Съвсем не
- 6 Променяли ли сте вашия стил на работа поради технологичното развитие? 1 2 3
3. Да. Повече от един път; 2. Да. Един път; 3. Не

**Въпроси относно влиянието на информационните и комуникационни технологии (ICT) върху обучението изобщо**

Моля, изразете до каква степен твърденията по-долу съвпадат с вашето мнение като използвате следната скала:

5 = Напълно съгласен

4 = Съгласен

3 = Нито съгласен нито несъгласен (не мога да определя)

2 = Несъгласен

1 = Напълно несъгласен

- 7 Благодарение на технологиите проблемът за достъпа на студенти с увреждания е напълно решен 1 2 3 4 5

- 8 Контактите между студенти и преподаватели може да имат същата интензивност при online (дистанционното) обучение, както и при обучението в клас 1 2 3 4 5

Online комуникацията позволява нарастване на обема  
9 на комуникациите между студенти и преподаватели в  
сравнение с останалите форми на обучение 1 2 3 4 5

Само оптимистично настроените хора смятат, че  
10 влиянието на технологиите върху обучението носи  
полза 1 2 3 4 5

От моя личен опит в обучението намирам, че  
11 влиянието на обучението върху технологиите е  
значимо 1 2 3 4 5

Информационните и комуникационни технологии  
12 обикновено се използват за да ни насърчават да бъдем  
активни участници в обучението 1 2 3 4 5

Информационните и комуникационни технологии се  
13 използват да поддържат развиването на  
високоинтелигентни умения, такива като *синтез* и  
*решаване на проблеми* 1 2 3 4 5

Информационните и комуникационни технологии се  
14 използват да поддържат по-индивидуализирани  
учебни програми, разработени според нашите лични  
нужди 1 2 3 4 5

Ученето се подобрява, когато текст и фигури  
15 (картинки) се интегрират в една мултимедийна среда 1 2 3 4 5

Обучаващите игри мотивират обучаемите и  
16 допринасят за развиване на умения за работа в екип 1 2 3 4 5

**Въпроси относно влиянието на информационните и комуникационни технологии (ICT) върху обучението в отворените университети**

17	Приложението на новите ICT концепции за поддръжка на ученето и преподаването и осигуряване на Интернет достъп до студентските административни процеси е подобрило дистанционното обучение	1	2	3	4	5
18	Технологиите улесняват достъпа до материалите за тези, които учат задочно	1	2	3	4	5
19	Университетските дипломи от отворените университети са сравними с тези от традиционните университети с редовно класно обучение	1	2	3	4	5
20	Няма разлика в резултатите, получени при обучение в отворен университет и традиционен университет с редовно класно обучение	1	2	3	4	5
21	Ученето в отворен университет има специално преимущество за възрастни, които имат професионални и семейни задължения	1	2	3	4	5

## Final Report of WP 3

## A.3 German Version

The questionnaire for the intervention group was published online.

### A.3.1 Email Sent to FernUniversität Students

On behalf of the German partner May 7, 2007, FernUniversität's Student Office sent out an email to 1500 students selected from FernUniversität's student database with the following content:

Von: "Studierendensekretariat" <Studierendensekretariat@FernUni-Hagen.de>  
Betreff: **Befragung zu den Auswirkungen des Einsatzes Neuer Medien und der IuK-Technik auf das Fernstudium**  
Datum: 7. Mai 2007 15:06:01 Uhr MESZ  
An: <stud-info@FernUni-Hagen.de>  
Antwort an: <Bernd.Kraemer@FernUni-Hagen.de>

---

Liebe Fernstudierende,

Im Rahmen eines zweijährigen EU-Projekts erforschen wir europaweit aus verschiedenen Perspektiven die Auswirkungen des Einsatzes Neuer Medien und der IuK-Technik auf das Studium an Hochschulen. Die erste Befragung untersucht das Thema aus der Perspektive von Fernstudierenden. Studierende von Präsenzuniversitäten in Bulgarien, Irland, Italien und Ungarn sind als Kontrollgruppen ebenfalls an der Befragung beteiligt.

Der Online-Fragebogen wird bis Ende Mai 2007 für Sie unter der URL

<https://eva.fernuni-hagen.de/nriWeb/nriWeb.dll?K.Projekt=dvtprojekt>

bereitgehalten. Ich möchte Sie herzlich bitten, den Fragebogen mit 21 Fragen auszufüllen. Sie müssen dafür etwa 10 Minuten Zeit einplanen. Um Ihr Engagement noch etwas zu beflügeln, werden unter den Teilnehmerinnen und Teilnehmern fünf amüsante Zukunftsromane des international bekannten Informatikers Prof. Hermann Maurer verlost. Wenn Sie an der Verlosung teilnehmen möchten, müssen Sie über den Fragebogen Ihre E-Mailadresse hinterlegen.

Die Ergebnisse werden nach Abschluss der europaweiten Befragung wissenschaftlich ausgewertet und in englischer Sprache bis spätestens Ende September 2007 veröffentlicht. Einen Hinweis auf die Veröffentlichung des Berichts und einen Verweis auf die PDF-Quelle können Sie dann auf der Webseite meines Lehrgebiets in der Rubrik „Aktuelles“ und auch auf der Startseite finden:

<http://www.dvt.fernuni-hagen.de/>

Die Befragung wird freundlicherweise von der Stabsstelle für Evaluation und Qualitätssicherung der FernUniversität durchgeführt. Sie können versichert sein, dass die Vertraulichkeit Ihrer Angaben uneingeschränkt gewahrt wird und die Daten anonym bleiben. Bei Rückfragen zur Befragung wenden Sie sich bitte an den Projektleiter, Prof. Dr.-Ing. Bernd Krämer (Tel. ++49-(0)2331-987-371, E-Mail: [bernd.kraemer@fernuni-hagen.de](mailto:bernd.kraemer@fernuni-hagen.de)).

Mit freundlichen Grüßen

Prof. Dr. Bernd Krämer  
(Lehrgebiet Datenverarbeitungstechnik, Fakultät für Mathematik und Informatik)

Antworten bitte an die Reply-To-Adresse.  
Nachrichten an [stud-info@fernuni-hagen.de](mailto:stud-info@fernuni-hagen.de) werden nicht gelesen.

### A.3.2 The Online Questionnaire

The welcome page of the German questionnaire provides information about the study, the estimated time to fill out the questionnaire and assures full anonymity and privacy.

The screenshot shows the welcome page of an online questionnaire. At the top left, it says 'Info1' and at the top right, the date and time '11.05.2007 16:47 Uhr'. The header features the logo of FernUniversität in Hagen and the text 'Lehrgebiet Datenverarbeitungstechnik'. Below the header, there is a progress bar showing '0%'. The main text reads: 'HERZLICH WILLKOMMEN im Online-Fragebogen für die Untersuchung der Auswirkungen Neuer Medien und der Informations- und Kommunikationstechnik (IuK) auf das Fernstudium. Sie werden etwa 10 Minuten benötigen, um diesen Fragebogen auszufüllen. Die Befragung ist ANONYM. Ihre Angaben werden vertraulich behandelt und für keinen weiteren Zweck verwendet.' At the bottom, there is a 'Weiter' button and contact information: 'Email: Dr. Christine von Prümmer Ute Rossié' and '© FernUniversität in Hagen'.

The next page shows a table with all items concerned with the impact of ICT on learning in general.

62%

**FRAGEN zu Auswirkungen der Informations- und Kommunikationstechnik (IuK) auf das LERNEN IM ALLGEMEINEN:**

Bitte äußern Sie Ihre Meinung in jeder Zeile, indem Sie auf einer Skala von 1 bis 5 das jeweils Zutreffende anklicken.  
Dabei bedeutet 1 = stimme voll und ganz zu; 2 = stimme weitgehend zu; 3 = weder-noch; 4 = stimme eher nicht zu; 5 = bin gänzlich anderer Meinung.

	1	2	3	4	5
Dank moderner IuK-Technologie ist das Problem des Bildungszugangs für behinderte Studierende gelöst.	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Kontakte zwischen Studierenden und Lehrenden können bei der Online-Lehre von gleicher Intensität sein wie beim Präsenzstudium.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>
Online-Kommunikation ermöglicht einen höheren Grad an Informationsaustausch zwischen Studierenden und Lehrenden als andere Lehr- und Lernformen.	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Nur Optimisten glauben, dass die Auswirkungen der IuK-Technologien auf das Lernen von Vorteil sind.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>
Aus meiner persönlichen Studierenerfahrung heraus finde ich, dass IuK-Technologien das Lernen bereichern.	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
IuK-Technologien werden vor allem eingesetzt, um Studierende zu ermutigen, sich aktiv in den Lernprozess einzubringen.	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
IuK-Technologien werden eingesetzt, um kognitiv höherwertige Lernprozesse wie Synthese- und Problemlösungsfähigkeiten zu unterstützen.	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
IuK-Technologien werden eingesetzt, um individualisierte Lehrangebote bereit zu stellen, die auf die Bedürfnisse einzelner Studierender zugeschnitten sind.	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Lernen wird verstärkt, wenn Lehrtexte und Bilder oder Animationen in eine multimediale Lernumgebung integriert sind.	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Lernspiele motivieren Studierende und tragen dazu bei, soziale Fähigkeiten wie Gruppenarbeit zu entwickeln.	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

## A.4 Hungarian Version

# Impact Távoktatás kérd\_ív

Ez a teszt az EU Impact projektjén belül kidolgozott, a technológia tanulásra gyakorolt hatásait vizsgáló kérd\_ívsorozatának els\_ része, mely a távoktatás keretein belül vizsgálja az infokommunikációs technológia szerepét.

Köszönjük a segítségét!

### Általános kérdések

---

1. Mi a foglalkozása?

- ☐ V e z e t \_ / m e n e d z s e r
- ☐ Alkalmazott
- ☐ O k t a t ó / t a n á r
- ☐ Hallgató
- ☐ Munkanélküli

2. Életkora?

- ☐ 2 4 v a g y f i a t a l a b b
- ☐ 25-29
- ☐ 30-40
- ☐ 41-50
- ☐ 50 felett

3. Neme?

- ☐ Férfi
- ☐ N\_

4. Legmagasabb iskolai végzettsége?

- ☒ Középiskola
- ☐ 1 - 3 é v i g t a r t ó f e l s \_ f o k ú t a n u l m á n y o k
- ☐ 4 vagy több évig tartó fels\_fokú tanulmányok

5. Milyen gyakran használ modern technikai eszközöket munkája/tanulása közben?

- ☐ N a g y o n g y a k r a n  
☐ Gyakran  
☐ Ritkán  
☐ N a g y o n r i t k á n  
☐ Soha

6. Technológiaváltás miatt kellett már megváltoztatnia munkavégzési szokásait?

- ☐ I g e n , t ö b b s z ö r  
☐ I g e n , e g y s z e r  
☐ Nem

### Kérdések az infokommunikációs technológia (ICT) tanulásra gyakorolt általános hatásairól

7. ICT és a tanulás

	Teljesen egyetértek		Egyáltalán nem értek egyet			
	1	2	3	4	5	Nem válaszol
A technológiának köszönhetően a fogyatékkal élők oktatáshoz való hozzáféréseinek problémái megoldódtak	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
A tanár-diák érintkezések intenzitása megegyezik az internetes (on-line) oktatásnál illetve az osztálytermi oktatásnál.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Az On-line (internet) kommunikációval segített tanulás más oktatási forrákhoz képest több interakciót tesz lehetővé az oktatók és a hallgatók között.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Csak az optimista emberek gondolják, hogy a technikai fejlődés az oktatásban haszonnal jár.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Saját tanulmányaim alapján úgy gondolom, hogy technikának értékes hatása van a tanulásra.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Az infokommunikációs technológia általában az oktatásban való aktívabb részvételre ösztönöz.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Az infokommunikációs technológiát a magasabb szintű gondolkodás, mint a szintetizálás vagy a problémamegoldás, fejlesztésének támogatására használják	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Az infokommunikációs technológiát az egyéni szükségleteink szerint személyreszabott képzési programok támogatásához használják.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Ha szöveget és képeket integrálunk multimédia környezetbe, akkor azzal növeljük az oktatás értékét.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Játékok alkalmazása motiválja a tanulókat és segíti olyan képességek kialakulását mint a csoportmunka.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

### Kérdések az ICT hatásáról a távoktatásban

#### 8. ICT a távoktatásban

	Teljesen egyetértek		Egyáltalán nem értek egyet			Nem válaszol
	1	2	3	4	5	
Új ICT koncepciók alkalmazása a tanulásban és az oktatásban, valamint a hallgatói adminisztráció interneten való elérése javítja a távoktatást.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
A nem nappali hallgatók számára a tananyagok elérése egyszerűbb ICT segítségével.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
A távoktatáson keresztül szerzett diploma egyenértékű a nappali tagozaton szerzett végzettséggel.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Nincs különbség a tanulás eredménye között a távoktatási illetve a nappali felsőoktatási programoknál	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
A távoktatás különösen jó annak, akinek már családja illetve munkahelye van.	<input type="checkbox"/>					

### Informazioni personali

#### 1. Qual è il tuo lavoro?

- ☐<sub>1</sub> Professionista/Dirigente  
☐<sub>2</sub> Tecnico  
☐<sub>3</sub> Insegnante/Istruttore  
☐<sub>4</sub> Studente  
☐<sub>5</sub> Disoccupato

#### 2. Età.

- ☐<sub>1</sub> 24 anni o meno  
☐<sub>2</sub> 25-29 anni  
☐<sub>3</sub> 30-40 anni  
☐<sub>4</sub> 41-50 anni  
☐<sub>5</sub> oltre i 50 anni

#### 3. Sesso.

- ☐<sub>1</sub> Maschio  
☐<sub>2</sub> Femmina

#### 4. Qual è il tuo livello di istruzione?

- ☐<sub>1</sub> Laurea o titolo equivalente  
☐<sub>2</sub> Da uno a tre anni di specializzazione post lauream  
☐<sub>3</sub> Quattro o più anni di specializzazione post lauream

#### 5. In che misura utilizzi attrezzature tecnologicamente avanzate nella tua attività professionale?

- ☐<sub>1</sub> Molto  
☐<sub>2</sub> Abbastanza  
☐<sub>3</sub> Poco  
☐<sub>4</sub> Molto poco  
☐<sub>5</sub> Per nulla

#### 6. Hai mai dovuto cambiare il tuo modo di lavorare a causa degli sviluppi tecnologici?

- ☐<sub>1</sub> Sì, più di una volta  
☐<sub>2</sub> Sì, una volta  
☐<sub>3</sub> No

### Domande sull'impatto dell'Information and Communications Technology (ICT) sull'apprendimento in generale

*Esprimi il tuo accordo o disaccordo con le affermazioni che seguono.*

#### 7. Grazie alla tecnologia sono stati risolti i problemi di accesso all'apprendimento delle persone con difficoltà percettive o motorie.

- ☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

#### 8. I rapporti fra docenti e studenti possono avere la medesima intensità nell'educazione faccia a faccia e in quella in rete.

- ☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

#### 9. La comunicazione in rete consente di aumentare, rispetto ad altre soluzioni, l'intensità dei flussi di informazione fra docenti e allievi.

- ☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

#### 10. Solo le persone ottimiste pensano che l'impatto della tecnologia sull'insegnamento sia vantaggioso.

- ☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

*segue sul retro...*

11. In una mia personale esperienza di studio ho riscontrato che l'impatto della tecnologia sull'insegnamento è di gran valore.

☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

12. L'ICT viene usata abitualmente per incoraggiarci ad essere partecipanti attivi nei processi dell'istruzione.

☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

13. L'ICT viene utilizzata per supportare lo sviluppo di abilità cognitive complesse di alto livello come la capacità di sintesi e la risoluzione di problemi.

☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

14. L'ICT viene utilizzata per supportare programmi di individualizzazione dell'istruzione in funzione dei bisogni individuali degli studenti.

☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

15. L'apprendimento è incentivato quando il testo e le immagini sono integrate in un ambiente multimediale.

☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

16. I giochi educativi motivano gli allievi e contribuiscono a sviluppare abilità come il lavoro di gruppo.

☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

### **Domande sull'impatto dell'ICT sull'istruzione nelle università a distanza**

17. L'applicazione delle nuove tecnologie per il supporto all'insegnamento e l'uso di Internet ha migliorato l'istruzione a distanza.

☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

18. La tecnologia facilita l'accesso a materiali di studio per gli studenti lavoratori.

☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

19. Il livello raggiunto dalle università a distanza può essere paragonabile a quello delle università tradizionali.

☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

20. Non vi è differenza nei risultati dell'apprendimento ottenuti studiando in una università a distanza e in una tradizionale.

☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

21. Frequentare una università a distanza rappresenta un vantaggio particolarmente per gli adulti che lavorano e hanno impegni familiari.

☐<sub>1</sub> molto d'accordo ☐<sub>2</sub> d'accordo ☐<sub>3</sub> incerto ☐<sub>4</sub> in disaccordo ☐<sub>5</sub> molto in disaccordo

***Grazie per la collaborazione!***

## B.1 Descriptive Analysis of the Intervention Group

\*. The mean difference is significant at the .05 level.

## Homogeneous Subsets

**Thanks to technology, the problems of access to learning for students with disabilities have been resolved**

Scheffe<sup>a,b</sup>

What is your occupation?	N	Subset for alpha = .05	
		1	2
Student	75	3,08	
Manager	66	3,44	3,44
Technical	58	3,47	3,47
Teacher or Trainer	82	3,62	3,62
Other (e.g. retired)	53	3,62	3,62
Unemployed	23		3,83
Sig.		,075	,402

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 49,889.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

**Contacts between students and teachers can have the same intensity in online education as in face-to-face education**

Scheffe<sup>a,b</sup>

What is your occupation?	N	Subset for alpha = .05	
		1	2
Teacher or Trainer	82	2,27	
Technical	58	2,47	2,47
Student	75	2,52	2,52
Manager	65	2,77	2,77
Unemployed	21	3,00	3,00
Other (e.g. retired)	53		3,08
Sig.		,059	,190

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 48,138.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

**Online communication allows increased amounts of communication between teachers and students when compared with other forms of education**

Scheffe<sup>a,b</sup>

What is your occupation?	N	Subset for alpha = . 05
		1
Technical	57	3,05
Student	75	3,07
Teacher or Trainer	82	3,21
Manager	65	3,38
Unemployed	23	3,43
Other (e.g. retired)	53	3,57
Sig.		,363

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 49,668.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

**Only optimistic people think that the impact of technology on learning is beneficial**

Scheffe<sup>a,b</sup>

		Subset for alpha = . 05
What is your occupation?	N	1
Student	74	3,35
Teacher or Trainer	82	3,44
Technical	58	3,50
Unemployed	23	3,57
Manager	65	3,77
Other (e.g. retired)	53	3,89
Sig.		,204

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 49,718.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

**From my personal study experience I find that the impact of technology on learning is valuable**

Scheffe<sup>a,b</sup>

		Subset for alpha = . 05
What is your occupation?	N	1
Unemployed	22	3,95
Student	75	4,00
Technical	58	4,10
Teacher or Trainer	82	4,13
Other (e.g. retired)	53	4,17
Manager	65	4,22
Sig.		,776

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 48,989.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

**Information and communications technology has usually been used to encourage us to be active participants in learning**

Scheffe<sup>a,b</sup>

		Subset for alpha = . 05
What is your occupation?	N	1
Technical	58	3,12
Manager	65	3,35
Teacher or Trainer	82	3,54
Other (e.g. retired)	53	3,55
Student	75	3,56
Unemployed	22	3,68
Sig.		,072

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 48,989.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

**Information and communications technology has been used to support the development of higher level thinking skills such as synthesis and problem solving**

Scheffe<sup>a,b</sup>

		Subset for alpha = . 05
What is your occupation?	N	1
Manager	65	3,26
Technical	58	3,29
Teacher or Trainer	82	3,32
Other (e.g. retired)	53	3,34
Unemployed	23	3,48
Student	75	3,63
Sig.		,540

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 49,792.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

**Information and communications technology has been used to support more individualized learning programmes tailored to our own individual needs**

Scheffe<sup>a,b</sup>

		Subset for alpha = . 05
What is your occupation?	N	1
Other (e.g. retired)	53	3,38
Technical	58	3,41
Manager	65	3,43
Unemployed	22	3,55
Teacher or Trainer	81	3,56
Student	75	3,65
Sig.		,851

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 48,929.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

### Learning is enhanced when text and pictures are integrated in a multimedia environment

Scheffe<sup>a,b</sup>

What is your occupation?	N	Subset for alpha = . 05
		1
Unemployed	22	3,91
Technical	57	4,07
Teacher or Trainer	82	4,10
Other (e.g. retired)	53	4,11
Student	75	4,13
Manager	66	4,21
Sig.		,654

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 48,961.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

### Educational games motivate learners and contribute to developing skills such as teamwork

Scheffe<sup>a,b</sup>

What is your occupation?	N	Subset for alpha = .05	
		1	2
Technical	58	3,38	
Unemployed	22	3,64	3,64
Manager	66	3,65	3,65
Other (e.g. retired)	53	3,74	3,74
Student	75	3,79	3,79
Teacher or Trainer	80		4,10
Sig.		,531	,376

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 48,960.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

### The application of new ICT concepts to support learning and teaching and provide Internet access to student administrative processes, has improved distance education

Scheffe<sup>a,b</sup>

What is your occupation?	N	Subset for alpha = .05	
		1	2
Student	62	3,82	
Manager	65	4,12	4,12
Teacher or Trainer	79	4,37	4,37
Other (e.g. retired)	53		4,45
Technical	57		4,46
Unemployed	19		4,47
Sig.		,077	,526

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 45,040.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

### Technology facilitates easier access to material for those studying part-time

Scheffe<sup>a,b</sup>

What is your occupation?	N	Subset for alpha = . 05
		1
Student	62	4,21
Unemployed	20	4,30
Other (e.g. retired)	53	4,40
Manager	65	4,46
Teacher or Trainer	79	4,54
Technical	57	4,65
Sig.		,221

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 45,948.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

### University degrees awarded by open universities may be comparable to degrees from traditional face-to-face universities

Scheffe<sup>a,b</sup>

What is your occupation?	N	Subset for alpha = .05	
		1	2
Student	62	3,08	
Teacher or Trainer	79	3,22	
Manager	64	3,58	3,58
Technical	57	3,70	3,70
Other (e.g. retired)	53		4,08
Unemployed	20		4,10
Sig.		,225	,427

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 45,863.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

### There is no difference in learning outcomes between studying at an Open University or at a traditional face-to-face university

Scheffe<sup>a,b</sup>

What is your occupation?	N	Subset for alpha = . 05
		1
Teacher or Trainer	79	2,92
Student	62	2,95
Manager	64	3,08
Technical	56	3,18
Other (e.g. retired)	53	3,49
Unemployed	20	3,65
Sig.		,069

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 45,754.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.

**Study at an Open University is especially of advantage to adults who have work and family obligations**

Scheffe<sup>a,b</sup>

What is your occupation?	N	Subset for alpha = .05	
		1	2
Student	62	4,15	
Manager	65		4,68
Unemployed	20		4,75
Teacher or Trainer	79		4,77
Technical	57		4,84
Other (e.g. retired)	53		4,89
Sig.		1,000	,841

Means for groups in homogeneous subsets are displayed.

- Uses Harmonic Mean Sample Size = 45,948.
- The group sizes are unequal. The harmonic mean of the group sizes is used. Type I error levels are not guaranteed.
